Whether you're a beginner or an experienced developer, this guide aims to help you understand the essential concepts and practical coding techniques to integrate 1-Wire devices into your embedded projects.

Understanding 1-Wire Protocol

What Is 1-Wire?

The 1-Wire protocol is a communication system that uses a single data line (and ground) to communicate with multiple devices. It is designed for low-speed, low-power applications, making it suitable for sensors, identification tags, and memory devices.

Key features of 1-Wire:

- Single data line communication
- Supports multiple devices on the same bus
- Uses unique 64-bit ROM codes for device identification
- Supports devices like temperature sensors (e.g., DS18B20), memory chips, and more

How 1-Wire Works

The master device initiates communication by sending reset pulses, followed by commands and data bits. Slave devices respond through presence pulses and data transmission. The protocol relies on precise timing to distinguish between logical '1' and '0' bits.

Basic steps:

- Reset pulse from the master
- Presence pulse from slave(s)
- Sending commands
- Data transfer (bit-by-bit)
- Acknowledgments and CRC checks for data integrity

Hardware Requirements

To implement 1-Wire communication with PIC microcontrollers, you need the following hardware components:

- PIC Microcontroller (e.g., PIC16F877A, PIC16F877)
- 1-Wire device (e.g., DS18B20 temperature sensor)
- Pull-up resistor (4.7k Ω to 10k Ω) for the data line
- Connecting wires and breadboard
- Power supply (typically 3.3V or 5V, depending on device)

Note: Ensure all connections are correct to prevent damage to the devices or microcontroller.

Software Setup and MikroC Environment

Before starting coding, set up MikroC PRO for PIC IDE:

- Install MikroC PRO for PIC from Microchip's official website.
- Create a new project for your PIC microcontroller.
- Configure the oscillator settings according to your hardware.
- Set up the correct pins for data line connection.

Connecting the Hardware

The typical wiring for DS18B20 with PIC:

- Connect the data pin of DS18B20 to a configurable I/O pin on the PIC (e.g., PORTB.0).
- Connect the pull-up resistor (4.7k Ω) between the data line and Vcc.
- Connect the Vcc and GND pins of DS18B20 to power and ground respectively.

Sample wiring diagram:

...

Vcc (3.3V/5V) ----> +5V

GND -----> GND

Data line ----> PIC pin (e.g., PORTB.0)

Pull-up resistor (4.7k?) ----> Data line ----> Vcc

## Interacting with a DS18B20 Temperature Sensor

The DS18B20 is a popular 1-Wire temperature sensor. To read temperature data:

- Send a reset pulse.
- Issue a Skip ROM command (`0xCC`) if only one device is on the bus.
- Send the Convert T command (`0x44`) to start temperature conversion.
- Wait for conversion to complete (~750ms for 12-bit resolution).
- Send another reset pulse.
- Issue Skip ROM (`0xCC`) again.
- Send Read Scratchpad command (`0xBE`).
- Read 9 bytes of scratchpad data.
- Calculate temperature from the first two bytes.

## Sample Code to Read Temperature from DS18B20

```
``c

void Read_Temperature(float temperature) {

unsigned char temp_LSB, temp_MSB;

unsigned int temp_read;

// Reset and check presence

if (OneWire_Reset()) {

// Device not present

temperature = -1000; // Error value

return;

}

// Skip ROM

OneWire_WriteByte(0xCC);

// Start temperature conversion
```

```
OneWire_WriteByte(0x44);

Delay_ms(750); // Wait for conversion

// Reset and check presence again

if (OneWire_Reset()) {

temperature = -1000;

return;

}

// Skip ROM

OneWire_WriteByte(0xCC);

// Read scratchpad

OneWire_WriteByte(0xBE);

// Read temperature bytes

temp_LSB = OneWire_ReadByte();

temp_MSB = OneWire_ReadByte();

// Combine bytes into a 16-bit value

temp_read = (temp_MSB
// Convert to Celsius

temperature = (float)temp_read / 16.0;

}

...
```

## Additional Tips for Reliable 1-Wire Communication

- Maintain precise timing using ``Delay_us()`` for each bit and reset pulse.
- Implement CRC checks for data integrity, especially when reading multiple bytes.
- Handle multiple devices on the bus by addressing their ROM codes.
- Power considerations: For long cable runs, consider parasitic power mode or external power supply.

## Configuring MikroC for 1-Wire Communication

### Setting Up the Microcontroller

- Choose your PIC model in MikroC.
- Configure the relevant GPIO pin as an open-drain or push-pull output, depending on your circuit design.
- Initialize the UART or other peripherals if needed, though 1-Wire is typically bit-banged with GPIO.

### Importance of Timing

- 1-Wire relies heavily on precise timing.
- MikroC's delay functions (e.g., `Delay_us()`) are essential for generating accurate signals.
- Be mindful of the clock frequency of your PIC, as delays depend on it.

## Implementing Reset Pulse

The reset pulse initiates communication and checks if a device responds.

presence = PORTC.Bit0;
```

```
// Wait for 410us to complete the reset sequence

Delay_us(410);

return (presence == 0); // If device pulls line low, presence detected

}

```
```

## Writing and Reading Bits

- Write Bit:

```
```c

void OneWire_WriteBit(bit bitValue) {

    TRISC.Bit0 = 0; // Drive line low

    LATC.Bit0 = 0;

    if (bitValue) {

        // Write '1' - pull low for 1-15us

        Delay_us(1);

        TRISC.Bit0 = 1; // Release line

        Delay_us(60);

    } else {

        // Write '0' - pull low for 60us

        Delay_us(60);

        TRISC.Bit0 = 1; // Release line

    }

}
```

```
Delay_us(1);
```

```
}
```

```
}
```

```
...
```

- Read Bit:

```
```c
```

```
bit OneWire_ReadBit() {
```

```
bit bitValue;
```

```
TRISC.Bit0 = 0; // Drive line low
```

```
LATC.Bit0 = 0;
```

```
Delay_us(1);
```

```
TRISC.Bit0 = 1; // Release line
```

```
Delay_us(14); // Wait for the device to respond
```

```
bitValue = PORTC.Bit0;
```

```
Delay_us(45); // Complete the timeslot
```

```
return bitValue;
```

```
}
```

```
...
```

## Writing and Reading Bytes

- Write Byte:

```
```c
```

```
void OneWire_WriteByte(unsigned char byteData) {
```

```
for (int i=0; i
```

```
OneWire_WriteBit((byteData & (1
```

```
Delay_us(1);
```

```
}
```

```
}
```

```
```
```

- Read Byte:

```
```c
```

```
unsigned char OneWire_ReadByte() {
```

```
unsigned char byteData = 0;
```

```
for (int i=0; i
```

```
if (OneWire_ReadBit()) {
```

byteData |= (1
```

```
}
```

```
Delay_us(1);
```

```
}

## Device Discovery and Communication

## Searching for Devices

- The 1-Wire protocol supports device enumeration through a search algorithm.
- Implementing the search algorithm involves recursive or iterative techniques to discover all device ROMs on the bus.
- MikroC code for search can be complex; for beginner purposes, focus on communicating with a known device address.

## Reading Data from Devices

- After reset, send the "Skip ROM" command (0xCC) if only one device is connected.
- Send the "Convert T" command (0x44) for temperature sensors like DS18B20.
- Wait for conversion to complete, then read scratchpad data (using commands 0xBE).

```
```c
```

```
// Example: Reading temperature from DS18B20
```

```
if (OneWire_Reset()) {
```

```
    OneWire_WriteByte(0xCC); // Skip ROM
```

```
    OneWire_WriteByte(0x44); // Convert T
```

```
    // Wait for conversion, typically 750ms for 12-bit resolution
```

```
    Delay_ms(750);
```

```
    OneWire_Reset();
```

```
    OneWire_WriteByte(0xCC);
```

```
    OneWire_WriteByte(0xBE); // Read Scratchpad
```

```
    unsigned int tempL = OneWire_ReadByte();
```

```
    unsigned int tempH = OneWire_ReadByte();
```

```
    int16_t tempRead = (tempH
```

```
float temperature = tempRead / 16.0;
```

```
}
```

```
...
```
