## Setting Up a Liferay Development Environment

Before diving into source code development, establishing a proper environment is crucial. Here are the essential steps:

### 2.1 Prerequisites

- Java Development Kit (JDK): Liferay 7.x supports Java 8 or higher.
- Database: MySQL, PostgreSQL, or other supported databases.

- Build Tools: Maven or Gradle, depending on project configuration.
- Integrated Development Environment (IDE): Eclipse, IntelliJ IDEA, or Visual Studio Code.
- Liferay Bundle: Official Liferay bundles are pre-configured packages with server and portal installed.

## 2.2 Installing Liferay Bundle

Download the latest Liferay bundle from the official website, such as:

- Liferay DXP (Commercial)
- Liferay Community Edition (CE)

Extract the bundle and run the server:

```
```bash
```

```
cd liferay-ce-
```

```
./gradlew clean deploy
```

```
```
```

or for Windows:

```
```cmd
```

```
gradlew.bat clean deploy
```

```
```
```

Once the server is running, access the portal via `http://localhost:8080` and proceed with customization.

## Creating a Liferay Project with Source Code

Developing custom functionalities involves creating portlets, themes, hooks, or modules. This section focuses on building a modular portlet project, which is the most common extension point.

### 2.1 Using Liferay Workspace

The recommended approach is to create a Liferay Workspace, a development environment that manages multiple modules.

Steps:

- Create a Workspace:

Using Liferay Blade CLI:

```
```bash  
  
blade create -t theme -p com.example.mytheme my-theme  
  
```
```

Or, create a workspace:

```
```bash  
  
blade init my-liferay-workspace  
  
```
```

- Add a Module (Portlet):

```
```bash  
  
cd my-liferay-workspace  
  
blade create -t portlet -p com.example.myportlet my-portlet  
  
```
```

This creates a structured project with predefined configurations, making it easier to develop, deploy, and maintain.

## 2.2 Understanding the Source Code Structure

A typical portlet project contains:

- `src/main/java/`: Java classes, portlet controllers, services.
- `src/main/resources/`: Configuration files, `portlet.xml`, `liferay-portlet.xml`.
- `src/main/webapp/`: JSPs, CSS, JavaScript, images.
- `build.gradle`: Build script with dependencies and build instructions.

## 2.3 Developing Custom Portlets

Key steps:

- Define Portlet Class:

```
```java
package com.example.myportlet;

import com.liferay.portal.kernel.portlet.bridges.mvc.MVCPortlet;

import javax.portlet.Portlet;

public class MyPortlet extends MVCPortlet {

    // Override methods or add custom logic

}
```
```

- Configure `portlet.xml` and `liferay-portlet.xml` to register the portlet.
- Create JSP Views for rendering UI.
- Add Dependencies: For example, Liferay MVC frameworks, API libraries.

## 2.4 Deploying the Portlet

Build the project:

```
```bash
```

```
./gradlew build
```

```
```
```

Deploy the resulting `.jar`` or `.war`` file into the Liferay server:

```
```bash
```

```
./gradlew deploy
```

```
```
```

Access the portal, navigate to the Site Builder, and add the custom portlet to a page.

## Best Practices for Liferay Development

Creating a scalable, maintainable Liferay project involves adhering to best practices:

### 3.1 Modular Design

- Utilize Liferay's modular architecture to break down functionalities into manageable modules.
- Follow OSGi best practices for service registration and dependency management.

### 3.2 Use of Service Builder

## Sample Source Code Snippet: A Basic Portlet

Here's an example of a minimal portlet class:

```
``java

package com.example.myportlet;

import com.liferay.portal.kernel.portlet.bridges.mvc.MVCPortlet;

import javax.portlet.Portlet;

public class HelloWorldPortlet extends MVCPortlet {

 // Custom logic can be added here

}

``
```

And a simple JSP view (`view.jsp`):

```
``jsp

Hello Liferay
Hello, Welcome to Liferay Portlet!

``
```

This forms the foundation for building more complex portlets with user interactions, data integration, and dynamic content.
