### What Are Solutions?

Solutions are homogeneous mixtures composed of two or more substances. In chemistry, solutions typically consist of a solvent and solutes. The solvent is the component present in the largest amount, while the solutes are the substances dissolved within the solvent.

### Key Definitions:

- Solution: Homogeneous mixture of two or more substances.
- Solvent: The component present in the largest amount.
- Solute: The substance dissolved in the solvent.

### Types of Solutions

Solutions can be classified based on the states of their components:

- Gaseous Solutions
  - Example: Air (a mixture of nitrogen, oxygen, carbon dioxide, and other gases)
  - Properties: Uniform composition, gases mix completely.

### - Liquid Solutions

- Example: Salt solution, sugar solution
- Properties: Transparency, fluidity, and ability to mix in any proportion depending on solubility.

### - Solid Solutions

- Example: Alloys like bronze, brass
- Properties: Homogeneous solids with improved strength and corrosion resistance.

## Concentration of Solutions

Understanding the concentration of solutions is vital for quantitative analysis. It indicates the amount of solute present in a given quantity of solution.

### Types of Concentration Measures:

- Molarity (M): Moles of solute per liter of solution.
- Molality (m): Moles of solute per kilogram of solvent.
- Normality (N): Gram equivalent weight of solute per liter of solution.
- Mass percentage (%): Mass of solute per 100 grams of solution.
- Volume percentage (%): Volume of solute per 100 mL or 100 mL of solution.

## Colligative Properties of Solutions

Colligative properties depend on the number of solute particles in a solution, not their identity.

- Nature of solute and solvent: Like dissolves like; polar solutes dissolve in polar solvents, non-polar in non-polar.

### Henry's Law

Henry's Law states that at a constant temperature, the amount of gas dissolved in a liquid is directly proportional to the partial pressure of the gas above the liquid.

#### Mathematically:

$$[C = kP]$$

Where:

- $[C]$  = concentration of gas
- $[P]$  = partial pressure
- $[k]$  = Henry's law constant

Applications:

- Carbonated beverages.
- Gas exchange in lungs.

## Electrolyte Solutions

Electrolytes are substances that produce ions in solution, conducting electricity.

Types of Electrolytes:

### Calculations and Problems in Solutions

- Preparing Solutions of Desired Concentration

Example: How to prepare 1 L of 0.5 M NaCl solution?

Solution:

- Moles of NaCl needed = Molarity  $\times$  Volume =  $0.5 \text{ mol/L} \times 1 \text{ L} = 0.5 \text{ mol}$ .
- Molar mass of NaCl ?  $58.5 \text{ g/mol}$ .
- Mass of NaCl =  $0.5 \text{ mol} \times 58.5 \text{ g/mol} = 29.25 \text{ g}$ .
- Dissolve  $29.25 \text{ g}$  of NaCl in water and make up to  $1 \text{ L}$ .

### - Dilution Calculations

Using the dilution formula:  $M_1V_1 = M_2V_2$

### Colligative Properties and Their Applications

Understanding colligative properties enables students to solve complex problems and appreciate real-world phenomena:

- Determining molar mass: Using freezing point depression or boiling point elevation.
- Osmotic pressure: Calculating the concentration of solutions based on osmotic pressure measurements.

Example: A solution of sugar has an osmotic pressure of 200 atm at 300 K. If the gas constant  $R = 0.0821 \text{ L}\cdot\text{atm}/\text{mol}\cdot\text{K}$ , find the molarity.

Solution:

$$\pi = MRT$$

$$M = \pi / (RT) = 200 / (0.0821 \times 300) \approx 8.12 \text{ mol/L}$$

### Practical Applications of Solutions

**Question Answer** What is the difference between saturated and unsaturated solutions in Class 12 chemistry? A saturated solution contains the maximum amount of solute dissolved at a given temperature, and no more solute can dissolve in it. An unsaturated solution has less solute than the maximum limit, and more solute can still dissolve in it. How is molarity calculated in Class 12 solutions? Molarity (M) is calculated as the number of moles of solute divided by the volume of solution in liters:  $M = \text{moles of solute} / \text{liters of solution}$ . What is molality and how does it differ from molarity? Molality (m) is the number of moles of solute per kilogram of solvent. Unlike molarity, molality is independent of temperature since it depends on mass, making it useful for colligative property calculations. Define osmotic pressure and its significance in solutions. Osmotic pressure is the pressure required to stop the osmosis of solvent into a solution through a semipermeable membrane. It is important for understanding processes like kidney function and preservation of food. What is Henry's law and how is it relevant to solutions? Henry's law states that the amount of gas dissolved in a liquid is directly proportional to the partial pressure of the gas above the liquid at constant temperature. It explains gas solubility in liquids. Explain the concept of colligative properties and their importance in solutions. Colligative properties depend only on the number of solute particles present, not their identity. Examples include boiling point elevation, freezing point depression, vapor pressure lowering, and osmotic pressure, useful for determining molar masses. What is Raoult's law and how does it relate to vapor pressure in solutions? Raoult's law states that the vapor pressure of a solvent above a solution is proportional to the mole fraction of the solvent. It explains how adding a non-volatile solute lowers the vapor pressure of the solvent. How do you

prepare a dilute solution from a concentrated solution in Class 12 chemistry? To prepare a dilute solution, use the formula  $C_1V_1 = C_2V_2$ , where  $C_1$  and  $V_1$  are the concentration and volume of the concentrated solution, and  $C_2$  and  $V_2$  are those of the dilute solution. Mix accordingly to achieve the desired concentration.
